Professional Summary

Java Full Stack Developer with 1+ year of full-time experience at KFin Technologies (preceded by a 4-month internship at the same firm), building microservices-based applications, event-driven pipelines, and enterprise-grade observability platforms. Strong expertise in REST API design, distributed systems, push-based streaming, and secure data transmission. Proficient in Agile/Scrum with a track record of full-cycle backend ownership — retained and promoted from intern to engineer on the basis of delivery performance.

Experience

KFin Technologies Limited — Hyderabad, India

Aug 2024 – Present

Software Engineer | Java Full Stack Developer

- Led delivery of four internal enterprise platforms — SRE Monitoring Tool, Asset Management System, DB Activity Monitoring, and Task Tracker — adopted by 4+ teams organization-wide.
- Architected **microservices-based REST APIs** with Spring Boot, JPA, and Hibernate; drove **P95 latency down by 20–30%** through query optimization, strategic indexing, and multi-layer caching.
- Built state-managed frontends with React.js and Redux; applied throttling, debouncing, and cursor-based pagination to reduce redundant network traffic by **~40%**.
- Eliminated polling-based updates by introducing **persistent WebSocket channels** for live log streaming and alerting, achieving near-zero latency message delivery.
- Enforced **fine-grained RBAC** via Spring Security, restricting data access and workflow actions to explicitly authorized roles across all platforms.
- Designed **Kafka** event-streaming topologies for asynchronous failure detection, cross-service notification, and decoupled data propagation.
- Deployed **Redis** as a distributed cache for hot-path reads, cutting average DB round-trips by over half and sustaining throughput under peak load.
- Hardened production observability with structured logging, global exception handling, and distributed request tracing — shrinking **MTTR by 25%**.
- Applied AES-based payload encryption on all sensitive inter-service calls, ensuring data confidentiality and meeting internal security compliance standards.
- Delivered consistently within **Agile/Scrum** sprints — led code reviews, contributed to retrospectives, and maintained zero critical defects post-release.
- Maintained **CI/CD pipelines** with JUnit-gated test stages (>80% coverage) ensuring zero untested code reached production.
- Awarded the **Team Skill & Will Award** for technical ownership and delivery consistency.

KFin Technologies Limited — Hyderabad, India

Apr 2024 – Aug 2024

Software Engineer Intern | Java Full Stack

- Contributed to SRE Monitoring Tool and Asset Management System during a **4-month internship**; converted to full-time Software Engineer on demonstrated performance.
- Built Spring Boot REST API modules and React.js components with Redux; attended sprint planning, design discussions, and peer code reviews within an Agile team.
- Wrote JUnit tests, resolved QA defects, and gained hands-on production exposure to Kafka, Redis, WebSockets, and Docker — directly applied in the full-time role.

Technical Skills

Languages: Java 11/17, JavaScript

Frontend: React.js, Redux

Backend: Spring Boot, Spring Security, JPA, Hibernate

Databases: PostgreSQL, MySQL, Redis

Messaging & Streaming: Apache Kafka, WebSockets

Architecture: Microservices, Event-Driven, RBAC, Distributed Systems, Caching

Security: AES Payload Encryption, Secure API Design, Role-Based Authorization

DevOps: Docker, Git, CI/CD Pipelines, Linux

Testing: JUnit, Integration Testing

Methodologies: Agile, Scrum, Code Review

Projects

SRE Monitoring Platform

React.js, Spring Boot, Kafka, Redis, WebSockets

- Enterprise observability platform tracking **1,00,000+ services** alongside their AMC contracts and asset health — metrics flow from emitters through Kafka, are cached in Redis, and pushed to the UI via WebSocket.
- Kafka-driven threshold engine delivered sub-second alerts and cut incident detection time by **~40%** across all monitored service domains.
- Pushed service state changes directly to dashboards over persistent socket connections, eliminating polling and cutting frontend overhead by **60%**.
- Joined AMC contract expiry signals with live service health to generate proactive maintenance alerts before SLA deadlines were breached.

- Embedded a contextual AI-assist chat with automated ticket creation, reducing mean triage time per incident by removing manual handoff steps.
- Implemented domain-scoped alert routing so each team received only the notifications relevant to their service group, reducing alert fatigue.

Asset Management System

React.js, Spring Boot, PostgreSQL, WebSockets, Kafka

- End-to-end lifecycle platform governing **15,000+ physical and digital assets** — spanning procurement, allocation, inter-department transfer, AMC contract linkage, and decommissioning.
- Pushed asset status changes (transfers, check-outs, returns) to all active sessions over persistent socket connections, giving every user an always-current view without manual refresh.
- Streamed state-change events via Kafka to downstream consumers — SRE monitoring and finance reporting — maintaining cross-system consistency without tight coupling.
- Applied **AES-256 field-level encryption** to sensitive contract values and asset metadata, satisfying internal data-security policies.
- Granular permission model restricted admins, managers, and viewers to strictly scoped data sets and actions, preventing unauthorized asset operations.
- Immutable audit trail recorded every state transition with actor identity, timestamp, and field-level delta — providing a tamper-evident log for compliance reviews.
- Executive dashboards exposed utilization rates, upcoming AMC renewals, and department-wise allocation summaries — enabling data-driven procurement decisions.

Database Activity Monitoring Tool

React.js, Spring Boot, WebSockets, Kafka

- Security and compliance platform capturing query execution, schema changes, and user sessions across **multiple DB instances** for auditing and threat detection.
- Forwarded live query streams to analyst dashboards over socket connections, enabling DBAs to spot suspicious patterns as they emerged rather than reviewing stale batch exports.
- High-throughput **Kafka ingestion layer** absorbed bursts of log events without back-pressure, decoupling database agents from the storage and processing tier.
- Encrypted agent-to-server log transmission with **TLS + payload signing**, preventing interception or tampering of sensitive query data in transit.
- Multi-axis filtering engine (user, query type, table, time window) enabled forensic drill-down across **millions of records** at interactive speeds.
- Rule-based anomaly engine triggered instant notifications on high-risk patterns — off-hours logins, mass deletions, privilege escalation attempts — with configurable severity thresholds.
- Scoped data visibility by role so only authorized personnel accessed query-level detail, preventing insider exposure of sensitive business data.

Task Tracker & Productivity System

React.js, Spring Boot, WebSockets

- Centralized work-management platform for a **50+ member** organization — tracking assignments, priority queues, deadlines, and cross-team delivery milestones.
- Broadcast task events (new assignments, status changes, deadline warnings) to subscribers via persistent socket channels, removing the need for any manual refresh cycle.
- **HTTPS + encrypted API payloads** secured all task metadata and user-activity data in transit, meeting organizational security requirements.
- Event-driven activity feed gave team leads a continuous, timestamped view of progress without polling or page navigation.
- Server-side pagination combined with request debouncing shrank dashboard load time by **35%** for teams managing hundreds of concurrent tasks.
- Reporting engine produced sprint-level summaries — completion rates, average cycle times, and overdue breakdowns — feeding data-driven retrospectives.
- Workload heatmap surfaced individual capacity imbalances, allowing managers to redistribute tasks before delivery dates slipped.

Education

Lakshmi Narain College of Technology

2022 – 2024

Master of Computer Applications (MCA)

Bundelkhand University

2017 – 2020

Bachelor of Science (Computer Science)
